

PROBLEM STATEMENT

1. In screening, it is hard to grade candidates in the AI Era <- purely from keywords and handwritten resume, projects and such.
2. Current grading -> ATS + Live code with proctoring (audio, cam, devices)

BUT nowadays everyone is using generative AI, to code and such, technical skills and experiences may not be as valuable as old days,

WHAT IF I want to see the thought process of how candidatee comes out the solution? <- Mentor help??

GOAL

1. Tackle or attack -> Ai assistant code with proctoring

SOLUTION

1. Asking to solve A, Throughout checking the prompt iteration from user, thought process can be extracted from the candidates.

Demo Categories

1. System design

scenario A:

name: Homepage Latency Spike

duration: 5 minutes

root_cause: Sequential API calls

symptoms:

- Homepage latency: 850 ms
- CPU: 35%
- Database: Healthy
- Recommendation service: Healthy
- Redis hit rate: 42%

available_tools:

- Metrics
- Logs
- Traces
- Source Code
- AI Assistant

Metrics

Iteration until solution

Effort/Tool calls (tool call, reasoning time and effort used, tokens)

Station investigated

Investigation order

AI prompts submitted

Number of hypotheses

Root cause identified

Challenge

1. List

Target user

1. Recruiter for Tech candidates
2. Tech candidates as client's user
3. Headhunter

Tackle area

1. Screening

Pre screen (ATS, keyword filtering) -> Screening (Human, LLMs grading) -> Post Screen (review) -> Human interview for theory etc.

Problem: xxxxxxxxxxxx

Difficult

Clock

Run

Submit

Description

Users have reported that the homepage feels slow. Engineering metrics show:

p95 homepage latency increased from **180ms** → **850ms**

CPU utilization is only **35%**

Your task is **not to rewrite the system**, but to identify the performance bottleneck and propose an improvement.

Output

Result

1. capture candidate prompt via hook -
2. got wrapper analyse the all prompt

beratdgan/Qwen3-14B-Interview-Coach

3. we need a prompt for coach to get the thought process of the candidate.

4. Thought processes

Metrics

1. Iteration
2. Effort (tool call, reasoning time and effort used, tokens)
3. Files & Folders grep, glob?
effectiveness = right sequence and right files (less loop)
4. time taken

If gamify

1. time taken
2. Station reaches (irrelevant station or relevant station)
- 3.
